## QUESTION

Which of the following differential equations has  $y = x$  as one of its particular solution?

$$(A) \frac{d^2y}{dx^2} - x^2 \frac{dy}{dx} + xy = x \quad (0.1)$$

## Solution: NUMERICAL METHOD

Consider,

$$\frac{d^2y}{dx^2} - x^2 \frac{dy}{dx} + xy = x \quad (0.2)$$

Assuming the initial conditions  $y(0) = 0$  and  $y'(0) = 1$ .

Solve it by splitting into two parts homogeneous and particulate parts.

$$y = y_p + y_h \quad (0.3)$$

## HOMOGENEOUS PART:

The associated homogeneous equation is:

$$\frac{d^2y}{dx^2} - x^2 \frac{dy}{dx} + xy = 0. \quad (0.4)$$

Assume a power series solution:

$$y_h = \sum_{n=0}^{\infty} a_n x^n. \quad (0.5)$$

The derivatives are:

$$\frac{dy_h}{dx} = \sum_{n=1}^{\infty} n a_n x^{n-1}, \quad \frac{d^2y_h}{dx^2} = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}. \quad (0.6)$$

Substitute into the homogeneous equation:

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} - x^2 \sum_{n=1}^{\infty} n a_n x^{n-1} + x \sum_{n=0}^{\infty} a_n x^n = 0. \quad (0.7)$$

Rewriting terms, we derive the recurrence relation:

$$a_{n+2} = \frac{n-2}{(n+2)(n+1)} a_{n-1}. \quad (0.8)$$

Apply the initial conditions

The initial conditions are:  $y(0) = 0 \Rightarrow a_0 = 0$ ,  
 $y'(0) = 1 \Rightarrow a_1 = 1$ .

Using the recurrence relation:

$$a_{n+2} = \frac{n-2}{(n+2)(n+1)} a_{n-1}, \quad (0.9)$$

we compute the coefficients:

- 1) For  $n = 0$ :  $a_0 = 0$
- 2) For  $n = 1$ :  $a_1 = 1$
- 3) For  $n = 2$ :  $a_2 = \frac{0-2}{(2+2)(2+1)} a_1 = \frac{-2}{12} = -\frac{1}{6}$
- 4) For  $n = 3$ :  $a_3 = \frac{1-2}{(3+2)(3+1)} a_2 = \frac{-1}{20} \cdot \left(-\frac{1}{6}\right) = \frac{1}{120}$
- 5) For  $n = 4$ :  $a_4 = \frac{2-2}{(4+2)(4+1)} a_3 = 0$

The pattern is:

$$a_{2k} = 0, \quad a_{2k+1} = \frac{(-1)^k}{(2k+1)!}. \quad (5.1)$$

Therefore, the homogeneous solution is:

$$y_h = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}. \quad (5.2)$$

### PARTICULATE PART:

The nonhomogeneous term is  $x$ . Assume a particular solution of the form:

$$y_p = Ax + B. \quad (5.3)$$

Compute derivatives:

$$\frac{dy_p}{dx} = A, \quad \frac{d^2 y_p}{dx^2} = 0. \quad (5.4)$$

Substitute into the original equation:

$$0 - x^2 A + x(Ax + B) = x. \quad (5.5)$$

Simplify:  $-x^2 A + Ax^2 + Bx = x$

Hence we get  $B = 1$

Since  $A$  does not appear explicitly in the final equation, it is effectively irrelevant, and  $A$  can be chosen such that:  $y_p = Ax + B = x$

This is done as to set a proper particulate equation as principle coefficient can not be zero

Therefore,

$$y(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!} + x \quad (5.6)$$

$$y(x) = x - \frac{x^3}{6} + \frac{x^5}{120} + \dots \quad (5.7)$$

Clearly,  $y = x$  is not the solution to the given equation.

## COMPUTATIONAL METHOD

We use the finite difference method to approximate the solution of the given differential equation:

$$\frac{d^2y}{dx^2} - x^2 \frac{dy}{dx} + xy = x. \quad (5.8)$$

The finite difference approximations for derivatives are:

$$\frac{dy}{dx} = \frac{y(x+h) - y(x)}{h} \quad (5.9)$$

$$\frac{d^2y}{dx^2} = \frac{\frac{dy}{dx}(x+h) - \frac{dy}{dx}(x)}{h}. \quad (5.10)$$

Rewriting the derivatives:

$$\frac{dy}{dx}(x+h) = \frac{dy}{dx}(x) + h \cdot \frac{d^2y}{dx^2}. \quad (5.11)$$

Substituting these approximations into the differential equation:

$$\frac{d^2y}{dx^2} = x^2 \frac{dy}{dx} - xy + x. \quad (5.12)$$

$$\frac{\frac{y(x+2h) - y(x+h)}{h} - \frac{y(x+h) - y(x)}{h}}{h} - x^2 \frac{y(x+h) - y(x)}{h} + xy = x. \quad (5.13)$$

Simplify the equation:

$$\frac{y(x+2h) - 2y(x+h) + y(x)}{h^2} - x^2 \frac{y(x+h) - y(x)}{h} + xy = x. \quad (5.14)$$

After generalising the above equations, we can:

1. Compute  $\frac{d^2y}{dx^2}$  using:

$$\frac{d^2y}{dx^2}[n] = x_n^2 \frac{dy}{dx}[n] - x_n y[n] + x_n. \quad (5.15)$$

2. Update  $\frac{dy}{dx}$  using:

$$\frac{dy}{dx}[n+1] = \frac{dy}{dx}[n] + h \cdot \frac{d^2y}{dx^2}[n]. \quad (5.16)$$

3. Update  $y(x)$  using:

$$y_{n+1} = y_n + h \cdot \frac{dy}{dx}(n). \quad (5.17)$$

Starting with initial conditions  $x_0 = 0$ ,  $y[0] = 0$ , and  $\frac{dy}{dx}[0] = 1$ , and using  $h = 0.1$ , iteratively compute  $y[n+1]$ ,  $\frac{dy}{dx}[n+1]$ , and  $\frac{d^2y}{dx^2}[n]$  for successive  $n$ .

From the figure below, clearly they don't coincide hence  $y = x$  is not a solution to the given differential equation.
